Glossary

<u>Attack</u>			<u>Defense</u>		
June 1	Injection	Alters original functionality or adds extra executions on the original services	<u>,</u>	Detection	Detect and notify the administrator about possible attacks happening, allowing live defence and tracing for forensic purposes.
	Memory	Targets the memory and storage of modern computers or hides its existence in the memory in fileless status		Mitigation	Decrease the possibility or effect of certain attacks
1	Race Condition	Abuses conditions of systems where their substantive behaviours are dependent on the sequence or timing of multiple uncontrollable events.		Education	Provide education to users to decrease the chance of being targeted
<u></u> (((•	Side Channel	Studies the outside behaviour to get information of the execution paths, resources used or other hidden details for further attack		Prevention	Stop some types of attack
<u>,</u> o@	Authentication	Breaks normal authentication process to perform actions with fake or privileged identity	<u>Vulnerability</u>	<u>'</u>	
	Web	Targets web services or redirects attacks towards other users by abusing web services	(/>	Code	Badly written code can allow malicious users to alter the functionality. Extra checking and safer coding practices are needed.
	System	Spreads through computers without user notice in the form of malicious software or bundle of attack commands that target basic system functionality and settings	©	System	Computer infrastructure with not enough security protection which in need of fine tuning and addition security measures.
	Human Factor	Tricks users to providing information of some privileged access or resources, also refers to insiders purposely doing damage to internal services		Environment	Badly configured execution environment that require fine- tuning to prevent leaking out information through the working environment and connections.
			8	User	Bad practices, habits or activities done by careless users or corrupted users with not enough awareness or affected by social and psychological skills.
				Management	Bad understanding of the harm of from company management leads to incomplete security policies and contingency procedures for using the company system infrastructure
